ABSTRACT

A system and method for analyzing agreements between a first party and a second party. The system is adapted to receive input data describing commitments and past performance between the first and second party, and to calculate a liability of the first and second party to one
5   another based on the data. The input data may include contractual terms between the first and second party forecasted demand from the first party, actual demand from the first party, and/or actual investment from the second party. The liability may include an investment required by the second party to meet the forecasted demand, reimbursement to the second party by the first party for over investment, and/or a penalty from the second party to the first party for under
10   investment.
